Q F S

Knapp QFS is formulated to remove even the most stubborn, built-up floor finishes. Knapp QFS is amazing because it requires no mechanical agitation to work. Simply dilute it with hot water, leave it in contact with the floor for about five minutes, and vacuum away the excess. Knapp QFS works so easily because it chemically breaks up the zinc cross-linking, and dissolves the acrylic matrix which holds a floor finish together.

- Excellent for hard to reach areas.
- Contains no ammonia.
- Efficient and easy-to-use.

Directions and Applications: Dilute Knapp QFS with hot water. For normal floor finish build-up, dilute 1 part to 3 parts water. For medium build-up, dilute 1 part to 2 parts water. For heavy build-up, dilute 1 part to 1 part water. Apply this solution to the floor using a string mop. Allow the solution to work, making sure that the floor remains wet. (CAUTION: The wet floor will be very slippery.) After 4 or 5 minutes, test to see if the process is complete by rubbing a small area with a coin or knife blade. Finish should be liquefied, completely separated from the floor. If any scraping is necessary to loosen the finish, the process is not complete. Continue to keep area wet and test again after a few minutes. When the finish is completely dissolved, vacuum up the solution with an autoscrubber or a wet vac with a squeegee.

Note: If solution is removed with mops, make sure that all solubilized finish is removed before the floor is allowed to dry. Knapp QFS is a powerful chemical blend. Certain floors such as asbestos tile or older, worn floors may be altered by Knapp QFS. Test a small, concealed area before stripping the entire floor.
First Aid: Avoid contact with eyes. For eye or skin contact, flush with water repeatedly for at least 15 minutes. If accidentally swallowed, give two glasses of water, and contact a physician immediately. Please refer to the MSDS for information. For emergencies, call 1-800-255-3924.

Only for Sale to, Use and Storage by Servicepersons.
